The effect of the thyroid gland upon the secretion and cholesterol content of bile. V. P. Bezuglov and L. M. Tutkevich. *Arch. sci. biol.* (U. S. S. R.) 13, 411-16 (in German 416)(1933).—Dogs with biliary fistulas were thyroidectomized, treated with tetrahydro- β -naphthylamine to stimulate the sympathetic nervous system and with "synergen" to paralyze it, and thyroxine was administered at various stages. The output of bile and its cholesterol content were detd. Thyroxine decreases the secretion of bile and excretion of cholesterol. These were increased by thyroidectomy. The thyroid acts upon liver cells as well as through the sympathetic nerves. The thyroid gland is a powerful regulator of cholesterol metabolism.

TITLE: Extraction-photometric determination of microamounts of tellurium by a tetramethylthiuram disulfide 27

SOURCE: Zhurnal analiticheskoy khimii, v. 21, no. 5, 1966, 564-567

TOPIC TAGS: tellurium, selenium, ion effect, thiuram

ABSTRACT: An extraction-photometric method has been suggested for determining tellurium with tetramethylthiuram disulfide (thiuram). Optimum conditions have been found for formation of the complex. The molar ratios of the interaction of tellurium with the reagent have been established. Beer's law is valid within 5--150 $\mu\text{g/ml}$ of tellurium in 5 ml. A method has been developed for separating tellurium from selenium. The experimental error for determining of tellurium is

Photodynamic action of erythrosin on the contractile muscle proteins. D. L. Rubinshtein, L. T. Tulochkina, and R. D. Grishchenko (Inst. Biol. Med. Chem., Acad. Med. Sci. U.S.S.R., Moscow). *Doklady Akad. Nauk S.S.S.R.* 76, 243-6(1951).—While neither light (elec. bulb) nor erythrosin alone show any effect on solns. of myosin, actin, or actomyosin, illumination of the latter substances in presence of the dye leads to significant changes. Actomyosin solns. increase in viscosity to a gel, which may be liquefied by shaking and then reformed; at the same time actomyosin also loses its hydrophilic properties. The increase of viscosity and the dehydration are independent processes. Increased concn. of the dye leads to shorter irradiation needed for gelling (hyperbolic curve); increase of protein concn. leads to increase of irradiation period for gelling. Myosin undergoes viscosity increase to gel formation, but this is not liquefied on shaking. Actin undergoes loss of viscosity and loss of ability to form a complex with myosin. Myosin loses its adenosinetriphosphate activity. Viscosity loss by actin is not caused by change from fibrillar to globular form. The changes in actin and myosin are irreversible as is the dehydration of actomyosin. The gelling action of actomyosin is similar to that caused by adenosinetriphosphate (1), which in this case is the energy supply, whereas light energy may be substituted for the 1 energy. It is suggested that SH groups in myosin participate in the gelling. Physiol. significance of the results is discussed. G. M. Komolapoff

TITLE: The effect of gravity on the development of organisms

SOURCE: Konferentsiya po aviatsionnoy i kosmicheskoy meditsine, 1963.
Aviatsionnaya i kosmicheskaya meditsina (Aviation and space medicine); materialy
konferentsii. Moscow, 1963, 56-60

TOPIC TAGS: gravity, centrifuge, organism development, physiological function,
rat, chronic centrifugation, blood composition, urine composition, Coriolis
acceleration

ABSTRACT: In this investigation, Baranov and his co-workers designed a centrifuge
for small animals with an arm radius of 135 cm which could be regulated to produce
artificial gravitational fields of from 4 to 5 g. The centrifuge was arranged
in such a way that the arms and cages at the end of the arms would simultaneously
rotate around their axes producing Coriolis accelerations. A single control panel

Card 1/3

ACCESSION NR: AT4042653

regulated the photography and illumination of cage interiors, automatic feeding of the animals, and the revolving rate of the centrifuge. It was possible to record five separate physiological functions from some specially prepared animals. Experiments were conducted on white rats, commencing on the first day after birth and continuing for 25 days. Litters consisting of 200 animals were divided into experimental and control groups. All animals were born at approximately the same time. Experimental animals were subjected to accelerations ranging from 1.5 to 3 g for periods of from 4 to 6 hours, 6 days per week. The weighing of all animals took place every three days as did biochemical assays of the blood and urine, tests of vestibular activity, and the determination of the time of sexual maturity in female animals. At the termination of the experiment, a comparative test of the response of both experimental and control animals to brief accelerations of 5, 10 and 20 g was conducted. After 20--25 days, the body weight of chronically centrifuged animals was 60--80% that of the controls. The composition of erythrocytes (89.6%), leukocytes (93.4%), and hemoglobin (99.1%) in the blood of experimental animals with respect to control animals reflected a slightly anemic condition. While blood albumin in experimental animals was somewhat lower than in the controls, serum mucoid composition was higher, indicating a change of dystrophic character. Urine assays of experimental animals showed that the levels of Diche-positive substance (48%), nitrogen (62%), creatine (31%),

Card 2/3

ACCESSION NR: AT4042653

and creatinine (60%) were lower than in the control animals. Finally, the estral cycle of experimental females was significantly altered, though one female gave normal birth to young. In the second investigation, control animals exposed to brief accelerations of 5 g showed noticeable increases in the level of non-esterified fatty acids, decreases in serum mucoid composition, and increases in the albumin-globulin ration. However, at 20 g there was an increase in serum mucoid composition and a decrease in the albumin-globulin ration. Biochemical variations in experimental animals subjected to the same accelerations were insignificant. The authors conclude that gravity plays a complex role in the physiological processes of the developing organism but that the true mechanism of this role is far from being understood.

TEXT:

The authors have studied biochemical processes in dogs
during training and after flights in rockets and satellite vehicles
particular attention being devoted to those processes which are
affected by stress conditions and by exposure to ionizing
radiation. The dogs were first adapted to space flight conditions,
in which they were exposed to vibrations of frequency 70 cycles and
amplitude 0.4 mm continued for up to 12 minutes, and to

Card 1/4

3

S/560/61/000/011/009/012
E027/635

Some aspects of ---

accelerations of 6-9 g continued for 5 - 12 minutes. Eighteen dogs were studied in all, of which five made space flights in 1958-59 while thirteen remained on the ground. The dogs Belka and Strelka were investigated before the flight and 2, 6, 13, 23, 25 and 32 days afterwards. One dog (Otvazhnaya) made five flights. Two rats and five mice of the C57 line were also studied after a flight in the second satellite. In the dogs, determinations were made of the fractional composition of the serum proteins, the serum mucoids, pseudocholinesterase activity, and the content of free and bound 21-hydroxy-20-kesteroids in the urine. During the training period marked fluctuations occurred in the serum proteins, both in the animals which made space flights and in the others. After acceleration in the centrifuge a rise in cholinesterase activity occurred, reaching a peak after two days and then declining, and there was also a rise in the content of serum mucoids and a fall in the total protein content of the serum. Similar, but less marked effects, were observed after exposure to vibration. A rise in serum mucoids occurred two to six days

Card 2/4

3

S/560/61/000/011/009/012
E027/635

Some aspects of ---

after return from a space flight, and after six days there was a rise in the total serum proteins. No definite changes were observed in cholinesterase activity. From a consideration of the results three states could be distinguished in the animals in response to training and space flights: (1) activation of functions; (2) a dystrophic condition, and (3) a reaction of stress type characterized by a reversible inhibition of functions. In investigations of the urine no particular changes were noted in the volume or the specific gravity during training or after a space flight. A decrease in the content of deoxycytidine was observed in Belka and an increase in Strelka. After exposure to vibration and acceleration an increase of deoxythymidine and Dische-positive substances in the urine was observed in Otavazhnaya. One month later the levels of both had returned to normal. A fall in the Dische-positive substances to 50% of the control values was found in the urine of five mice five days after a space flight in the second satellite. It was concluded that

Card 3/4

3

5/560/61/000/011/009/012
E027/635

Some aspects of ---

the results indicated the occurrence of disturbances in the metabolism of deoxyribonucleic acid after a space flight, but that these disturbances were temporary and reversible. The responses of the animals resembled a stress reaction rather than radiation damage. There are 6 figures and 2 tables. ✓

TITLE: Shifts in some metabolic indices in soviet cosmonauts

SOURCE: Konferentsiya po aviatsionnoy i kosmicheskoy meditsine, 1963.
Aviatsionnaya i kosmicheskaya meditsina (Aviation and space medicine); materialy*
konferentsii. Moscow, 1963, 456-460

TOPIC TAGS: metabolic index, cosmonaut training, blood analysis, urine analysis,
hydrocorticosteroid, biochemical testing, Dische-positive substance

ABSTRACT: Biochemical studies of the blood and urine of cosmonauts, conducted
after training sessions and rest periods before space flight, and for several days
following space flight, included the following: 1) refractometer determination of
total blood serum protein; 2) determination of the relative protein fraction con-
tent of blood serum by paper electrophoresis; 3) concentration in the serum of
low-molecular-weight acid mucoids; 4) study of the nonspecific cholinesterase
activity in the blood serum; 5) determination of the amounts of Dische-positive
substances present in the urine; 6) viscosimetric determination of urine deoxyribo-

Card 1/4

ACCESSION NR: AT4042717

nuclease activity; 7) determination of the amount of free and bound 21-hydroxy-20-ketosteroids in the urine; 8) determination of the amount of mucoids present in the urine (after 5-day dialysis); and 9) determination of the amount of creatine and creatinine in the urine. In addition, ordinary clinical studies of peripheral blood and urine were made before and after flight. The most characteristic pre-flight blood serum composition change noted during training sessions was a slight increase in relative albumin and some decrease in Beta- and Gamma-globulin. This reaction is normally observed in athletes during training and contests and is connected with increased physical strain and emotional tension. Cosmonaut training occasionally produced still stronger effects (Nikolayev and Popovich, 1 Jun 62). During rest periods, serum protein composition and mucoid content usually returned to normal. After flight total protein and serum mucoid levels increased slightly in the first day after landing. No real change in cholinesterase activity was noted. Peripheral blood studies revealed no abnormality in Gagarin either before or after flight. Titov, Nikolayev, and Popovich displayed leukocytosis on the day of landing. In addition, Nikolayev and Popovich showed lymphopenia and a tendency to eosinopenia. These shifts which were of brief duration, are characteristic of the "stress" reaction. Preflight urinalysis showed no abnormalities. Postflight urinalysis showed turbidity, hyaline casts (8 to 15 in the preparation), and uric

Cord 2/4

ACCESSION NR: AT4042717

acid crystals in the urine of Nikolayev and Popovich. Protein traces and occasional erythrocytes and leukocytes were also found in the urine of Popovich. These were probably the result of reversible changes in the renal filter such as are sometimes observed following physical strain or strong emotion. Changes in urinary excretion of Dische-positive substances mostly failed to correlate with changes in the rate of urinary output. Urine 24-hr volumes, which before flight varied in the rate of cosmonauts from considerably below normal to somewhat above, increased by 25% to 75% in all cosmonauts after return from space flight, then returned to normal. Free hydrocorticosteroids were slightly increased by training sessions but returned to normal afterwards. After flight, free hydrocorticosteroids increased to 2.5 to 3.5 times the normal level. In Gagarin the increase was 10.7 times normal. Glucuronic acid bound steroids remained within normal limits except for Nikolayev, in whom they were somewhat increased. Steroid increase in the urine after space flight indicates functional stimulation of the adrenal cortex and may be regarded as an adaptive reaction of the body to various space-flight and landing factors. Return to normal even in the case (Gagarin) of a great increase indicates that the effects of these factors did not exceed the physiological capabilities of the adrenal glands. Mucoprotein increase during the training period is attributed to fatigue; it is normal under various circumstances, particularly heavy muscular labor.

Card 13/4

ACCESSION NR: AT4042717

After flight the mucoprotein urine levels were either normal or close to normal. Creatine and creatinine determinations were performed only in the case of Nikolayev and Popovich. On the first day after return from flight, both showed a considerable increase in the amount of creatinine, which attained values of 2.01 and 2.60 g for the 24-hr urine respectively. The creatine content remained normal (traces only). Creatinine levels had returned to normal in both cases 14 days after landing. Increased creatinine levels reflect increased physical loads on the organism and increased muscular effort, with a consequent increase in the catabolism of muscle protein. Generally, the biochemical changes observed in the cosmonauts during training for space flight and after landing indicate the occurrence of reversible and short-term metabolic changes characteristic of a brief stress reaction in the organism.

TITLE: Some metabolic indices in cosmonauts

SOURCE: AN SSSR. Otdeleniye biologicheskikh nauk. Problemy* kosmicheskoy biologii, v. 3, 1964, 145-158

TOPIC TAGS: manned space flight, nutrition, metabolism, hematology, urine, biochemistry

ABSTRACT: Biochemical analyses of the blood and urine of cosmonauts were made during training periods, after rest periods, and before and immediately after space flight. During periods of intensive training, space pilots revealed changes in the protein composition of their blood serum: a small increase in the relative albumin content and a decrease in the content of α_2 , β , and gamma globulins and mucoids, which is typical of athletes in training and is due to increased physical loads and emotional strain. During intensive training, the urine showed a decrease in Dische-positive substances, a decrease in the enzymic activity of acid deoxyribonuclease, an increase in the amount of adrenal hormones

Card

1/2

2

ACCESSION NR: AT4037684

(free 21-oxy-20 ketocorticosteroids), and, in some cases, mucoids. During rest periods, the levels of all these substances in blood and urine usually returned to normal. After space flight, the total protein content in the blood of cosmonauts increased to normal levels or exceeded them, and during longer flights (three and four days) the level of serum mucoids somewhat increased. At the same time, the content of free 21-oxy-20 ketocorticosteroids in the urine rose sharply as the level of steroids coupled with glucuronic acid increased to the upper normal level. The amount of creatinine increased distinctly also. Dische-positive substances and the activity of acid deoxyribonuclease in urine decreased. The changes in the content of Dische-positive substances and the activity of acid deoxyribonuclease in urine during the pre- and the post-start periods appeared to be opposite to those occurring under the action of ionizing radiation. All biochemical shifts discovered in the organisms of space pilots during their preparation for space flight and after their return indicate that some metabolic changes are reversible and rapidly returned to normal.

Effect of small additions of titanium in aluminum bronze. Trudy
Giprotsetmetobrabotka no.18:37-45 '60. (MIRA 13:10)
(Aluminum bronze) (Titanium)

27922

S/123/61/000/017/005/024
A004/A101

18 1220

AUTHOR: Tutorskaya, N. N.

TITLE: The effect of small titanium additions on aluminum bronze

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 17, 1961, 17, abstract
17A123 ("Tr. Gos. n.-1. i proyekt. in-ta po obrabotke tsvetn. met.",
1960, no. 18, 37-45)

TEXT: The author studied the effect of small Ti-additions on the structure
and mechanical properties of aluminum bronze. It was found that an addition of
0.005 - 0.3% Ti practically does not increase the mechanical properties of the
investigated alloys in the cast state. An addition of 0.05% Ti to the bronze
grades БРА7 (BR.A7), БРАМ₉-2 (BR.AMts9-2) and БРАЖ 9-4 (BR.AZh9-4)
noticeably increases their ductility in the embrittlement zone.

TITLE: Alloy for brazing zirconium. Class 49, No. 190178 [announced
by State Scientific Research and Design Institute of Alloys and Non-
Ferrous Metals Processing (Gosudarstvennyy nauchno-issledovatel'skiy i
proektnyy institut splavov i obrabotki tsvetnykh metallov)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 1,
1967, 125-126

TOPIC TAGS: brazing alloy, copper ^{brazing} palladium ^{containing} alloy, zirconium containing
alloy, titanium containing alloy, metal *brazing*

ABSTRACT: This Author Certificate introduces an alloy containing copper and palladium
for brazing zirconium. To improve the quality of brazed joints, zirconium
is added to the alloy. In a variant, components of the alloy are set as
follows: palladium 19—20%, zirconium 3—4.5%, copper balance; in alloy
containing 17—20% palladium, and 2—3% zirconium, 1.0—1.5% titanium is
added (copper balance). [AZ]

TITLE: On the changes in carboxyl-containing butadiene-styrene rubbers and their mixtures with ϵ -caprolactam under the action of γ -rays

PERIODICAL: Referativnyy byulleten' Bolgarskoy nauchnoy literatury, Khimiya i khimicheskaya tekhnologiya, no. 2, 1962, 6, abstract 102, God. Khim.-tekhnol. inst. 6, 1960, book 1 and 2, 1961 (Dep. 1962), pp 51-63 (Rus. and Eng. summaries)

TEXT: Carboxyl-containing butadiene-styrene rubbers were γ -irradiated from a Co^{60} source with doses of 0.1 - 50 megaröntgens. Losses of carboxylic groups were determined, particularly at low doses. This process occurs as a result of a complex structurization mechanism which is also accompanied by some destruction. A linear relation exists between the amount of carboxylic groups lost and the radiochemical yield. During the irradiation of a mixture of carboxy-

late rubber with ϵ -caprolactam, addition of the ϵ -caprolactam to the rubber is observed (along the bonded nitrogen). The plot of the amount of caprolactam added on at various doses of radiation exhibits a maximum. This is ascribed to destruction of bonded ϵ -caprolactam, with evolution of nitrogen.

TITLE: The Mechanism of Vulcanization in the Presence of 2-Mercaptobenzothiazole (Mekhanizm vulkanizatsii v prisutstvii 2-merkaptobenzotiazola)

PERIODICAL: Kolloidnyy zhurnal, 1958, vol XX, Nr 3, pp 279-287 (USSR)

ABSTRACT: One of the most-widely used accelerators of vulcanization is mercaptobenzothiazole (MBT), named also kaptaks. The mechanism of its action has been studied in the article. In the interaction of MBT and sulfur in the temperature range 140-180°C, H₂S develops. The energy of the activation process is 33.5 kcal/mole. This value is so high that the mentioned reaction cannot be regarded as the principal vulcanization reaction. One of the intermediate, formed in the vulcanization process is a polysulfide of the composition:

APPROVED FOR RELEASE: 04/03/2001

CIA-RDP86-00513R001757620008-5"

which has been extracted from the mixture by isotope exchange and identified by elementary analysis and spectroscopy. During heating in the press at vulcanization temperatures, MBT does not combine with the rubber. MBT reacts with rubber

69-20-3-4/24

The Mechanism of Vulcanization in the Presence of 2-Mercaptobenzothiazole

only in the presence of sulfur during the vulcanization process. The activation energy of the addition of sulfur to natural rubber without an accelerator, and in the presence of MBT at the temperature range of 120-160°C, is 35.5 and 20.95 kcal/mole respectively. It is supposed that the mechanism of the accelerating action of MBT is determined by the formation of 2-thiobenzothiazolyl and persulfhydryl radicals. There are 14 graphs and 23 references, 15 of which are Soviet, 3 English, 2 American, 2 German, and 1 Czechoslovakian.

International symposium on macromolecular chemistry. Moscow, 1960.

Metodurovnyy simpozium po makromolekulyarnoy khimii SSSR, Moskva, 14-18 Iyunya 1960 g.; doklady i avtoreferaty. Sektsiya III. (International Symposium on Macromolecular Chemistry Held in Moscow, June 14-18, 1960; Papers and Summaries) Section III. [Moscow, Izd-vo AN SSSR, 1960] 469 p. 55,000 copies printed.

Tech. Ed.: P. S. Kashina.

Sponsoring Agency: The International Union of Pure and Applied Chemistry. Commission on Macromolecular Chemistry.

PURPOSE: This book is intended for chemists interested in polymerization reactions and the synthesis of high molecular compounds.

COVERAGE: This is Section III of a multivolume work containing papers on macromolecular chemistry. The articles in general deal with the kinetics of polymerization reactions, the synthesis of special-purpose polymers, e.g., ion exchange resins, semiconductor materials, etc., methods of analyzing polymerization reactions, properties and chemical interactions of high molecular materials, and the effects of various factors on polymerization and the degradation of high molecular compounds. No personalities are mentioned. References given follow the articles.

TITLE: Conversions of Carboxylated Butadiene-styrene Rubbers
Under the Action of Gamma Radiation ¹⁵

PERIODICAL: ¹⁹ Vysokomolekulyarnyye soyedineniya, 1960, Vol. 2, No. 2,
pp. 259-264

TEXT: Carboxylated butadiene-styrene rubber with 30% of styrene, 1.30 and 1.60% of methacrylic acid; 50% of styrene and 2.88 or 5.43% of methacrylic acid were irradiated as 0.5 mm thick films in an argon atmosphere with 0.05% of oxygen from a Co⁶⁰ source of the type K-20 (K-20), with 0.1 - 50 Mr. The following were determined on the irradiated samples: number of the remaining carboxyl groups (Fig. 1, Table 1); gel content (Fig. 2, Table 2); viscosity of the brine fraction (Fig. 3); maximum swelling in benzene or methylethylketone (Fig. 4); and the formation of cross-links (Fig. 5, Table 3). The results are as follows: Under the effect of gamma radiation a loss of carboxyl groups occurs,

which is particularly heavy with a small radiation dose. The connection observed between the quantities of gel formed and carboxyl groups consumed indicates a complicated process of structure formation and destruction. The latter is seen in a decrease, especially rapid with small doses, of viscosity of the brine fraction. Intensive interlacing is caused by raising the methacrylic acid content. There is a linear relation between the number of carboxyl groups and the number of cross-links formed. The number of cross-links calculated from the data of the swelling agrees well with radiation doses of up to 20 Mr with the number calculated from the carboxyl groups consumed. There are 5 figures, 3 tables, and 6 references: 3 Soviet and 3 US.

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 8, 1966, 78

TOPIC TAGS: natural rubber, synthetic rubber, aminophenol, hydroxy compound, aromatic hydroxy compound, rubber modification

ABSTRACT: An Author Certificate has been issued for a method of modifying natural and synthetic rubbers by introducing hexamethylenetetramine and aromatic hydroxy compounds into the mixture. To improve the physical and mechanical properties of the rubber, aminophenols are used as an aromatic hydroxy compound. [Translation] [NT]

TITLE: Kinetic characteristics of chemical reactions of high molecular compounds

SOURCE: Uspekhi khimii, v. 35, no. 1, 1966, 191-199

TOPIC TAGS: chemical kinetics, macromolecular chemistry

ABSTRACT: The study of the kinetic characteristics of homogeneous macromolecular reactions is attracting the steady attention of researchers. The interest in this area is brought about by the search for ways to control chemical transformations of polymers and to conduct controlled reactions to obtain chemical derivatives with desired properties. Comparing the kinetic parameters of functional groups included in the polymer chain with the analogous parameters of those same groups in low molecular compounds, one can assume a number of factors which reduce the pre-exponential numbers of the Arrhenius equation in the case of large molecules. First, it follows from the kinetic theory that with an increase in the size (mass) of the molecule the Brownian motion rate of the molecule is lowered. Second, the high viscosity of polymeric solutions reduces the number of collisions of reacting groups.

ACC NR: AP6035961

Third, the steric factor is high because of shielding of functional groups as a result of folding of the polymeric chains. With the regular succession of the functional groups in the polymer chain, the interaction of neighboring groups can reflect the activation energy. This review is devoted to explaining the effect of the factor of including functional groups in the polymeric chain and of the interaction of alternated functional groups on the kinetic parameters of macromolecular reactions. TITLE: Chemical modification of vulcanizates. 2. Reaction of comminuted vulcanizates with p-tert.butylphenylformaldehyde resin

SOURCE: Vy*sokomolekulyarny*ye soyedineniya, v. 5, no. 7, 1963, 1059-1061

TOPIC TAGS: vulcanizate, revulcanization, butylphenylformaldehyde resin

ABSTRACT: Revulcanization of natural vulcanized rubber by means of p-tert.butylphenolformaldehyde resin (BPF)¹ was conducted on samples of natural vulcanized rubber without previous regeneration of the latter. The comminuted vulcanized rubber was mixed with BPF, followed by heating within a 140-180C range for 20-120 min. periods in the presence of zinc chloride or stannous chlorides as activators. The amount of bound resin was estimated by the difference between the added and the acetone-extractable resin. It was found that at an early stage nearly 90% of the resin became bound to the vulcanizate. The effect of vulcanization was checked by means of the swelling test in xylene. It was found that at 160C the addition of from 10 to 60% of BPF reduces within 30 minutes the percentage of swelling of the vulcanizate from 370 to 221, with further reduction to 201 within 120 min. The

authors claim that a superior vulcanized polymer is obtained which possesses a higher temperature of plastic flow as well as greater strength, which is attributed to a chemical process where the hydrocarbon end of BPF becomes linked to the original vulcanized rubber material. Orig. art. has: 1 chart and 1 table.

TITLE: Adhesion of Polymers. VII. Adhesion of Carboxylated Polymers
to Different Types of Substrates

PERIODICAL: Vysokomolekulyarnyye soyedineniya, 1960, Vol. 2, No. 11,
pp. 1671 - 1677

TEXT: The authors studied the effect of the carboxyl group on the adhesion of styrene rubbers to polar polyamide (Perfol type PK-4) and to nonpolar polyethylene. In tire cord impregnated with carboxylated butadiene-styrene latex a stronger bond was observed between rubber and cord than is provided by impregnation with ordinary butadiene-styrene latex. The joint between copolymer and substrate was prepared by a method described in Ref. 10. The quantitative determination of adhesion was made at room temperature and a constant separation rate of 0.3 cm/sec by means of an "adhesiometer" of TanIKZ. Resistance in g/cm (opposed by the joint to separation) was taken as the measure of adhesion. 1) The effect of the
